Suggestions For Sowing Seeds During the Summer Months

During the hot months of July and August fine seeds such as Calceolaria, Cineraria, Snapdragon, and finer perennial seeds, etc. should be sown in flats (as usual) and the flats placed in a cool basement until the seedlings sprout, then taken to greenhouse and some cheesecloth placed over them until the seedlings are of sufficient strength to have it removed.

SWEET PEAS

— PLEASE NOTE —

White seeded Sweet Peas should be sown in well moistened soil and no water must be applied until the plants are 2 or 3 inches high. When sown in small pots or under conditions where watering is necessary before they are up, THEY WILL SURELY ROT.

CUTHBERTSON STRAIN

For greenhouse sowing between October and February, this strain will make stronger growth than the Early or Winter class, although they will flower 10 days later. For outdoor planting they come in bloom a little earlier. They will produce a longer stem than either the Earlies or the Late flowering kinds.
